- 01 Executive KPI dashboards
- 02 Lead and lifecycle reporting
- 03 Pipeline and revenue visibility
- 04 Workflow performance analytics
- 05 Forms, segments, and governance

PORTFOLIO EVIDENCE

Live HubSpot screenshots used throughout the case study.

The reporting challenge and implementation scope

A connected reporting layer was required across sales activity, lifecycle stages, automation, and CRM governance.

CLIENT CHALLENGE

Sales and marketing data existed across HubSpot, but leadership needed one dependable view of performance.

- Activity, lead, deal, and workflow reporting were reviewed separately.
- Revenue and pipeline health needed consistent stage-level visibility.
- Lifecycle and automation data required clearer governance.
- Managers needed faster access to operational KPIs.

SOURCE EVIDENCE

This live dashboard combines sales activity totals with goal tracking. It gives managers a quick view of email, meeting, call, task, and target performance without opening multiple reports. The screenshot also demonstrates how filters and comparison periods are applied inside HubSpot.

HubSpot reporting architecture

The operating model connects data capture, CRM structure, automation, measurement, and management action.

SCREENSHOT SUMMARY

The automation overview shows the range of HubSpot processes available to the portal. These automation inputs feed standardized CRM data into reporting, so dashboards reflect consistent lead, deal, and lifecycle activity.

Sales activity and operating KPIs

A single management view supports faster review of team activity, deal creation, and goal performance.

SCREENSHOT SUMMARY
The executive dashboard consolidates daily sales activity and outcome metrics into one management view. It helps leadership review productivity, contact engagement, deal creation, and closed-won performance while keeping the reporting period and filters visible.

Team activity reporting

Activity reporting helps managers compare channel usage, follow-up volume, and sales execution.

MANAGEMENT USE

- Track email, meeting, call, and task volume.
- Compare activity against the previous reporting period.
- Identify channels used most often by the sales team.
- Support coaching, workload review, and follow-up planning.

SCREENSHOT SUMMARY
This report breaks team activity into calls, emails, meetings, and tasks, then compares selected metrics with the previous period. Managers can use it to identify follow-up patterns, uneven workloads, and changes in rep activity before they affect pipeline coverage.

Goal tracking and KPI quality

Goal reports must be configured and reviewed so executive dashboards remain actionable and accurate.

QA REVIEW

This view highlights a reporting control point: the goal series is present, but its values are currently zero.

- Validate goal targets and reporting periods.
- Confirm the correct deal amount and currency fields.
- Apply pipeline and team filters consistently.
- Separate missing configuration from true zero performance.

SCREENSHOT SUMMARY

The goal report exposes an important data-quality issue: a chart can be technically available while still showing zero values because targets, filters, currency fields, or reporting periods are not configured correctly. The portfolio treats report validation as part of implementation, not as an afterthought.

Reporting principle

A dashboard is only useful when its filters, targets, and metric definitions are governed alongside the visualization.

Lifecycle governance and funnel visibility

Standardized lifecycle stages create a shared reporting structure from subscriber through customer.

STAGE MODEL

Subscriber

Lead

MQL

SQL

Opportunity

Customer

Stable stage IDs and calculated properties support lifecycle and conversion reporting.

SCREENSHOT SUMMARY
The lifecycle settings screen shows the shared stage framework used by marketing and sales. Counts by stage reveal how records are distributed across the funnel, while stable stage IDs and calculated properties make conversion and progression reports more dependable.

Lifecycle configuration evidence

The stage configuration provides the foundation for lead distribution, funnel conversion, and customer reporting.

Lead	☒	5,358	-- Add rule	lead	
Marketing Qualified Lead	☒	305	--	marketingqualifiedlead	
Sales Qualified Lead	☒	2	--	salesqualifiedlead	

SCREENSHOT SUMMARY

This configuration view confirms that lifecycle stages are not merely labels. They act as governed reporting dimensions that support lead distribution, MQL-to-SQL conversion, opportunity creation, customer counts, and historical funnel analysis.

Why this matters

The screenshots connect workflow logic with the deal pipeline that ultimately feeds reporting. Reliable dashboards depend on controlled enrollment triggers, standardized stages, consistent property updates, and predictable record movement across CRM objects. This prevents incomplete or misleading pipeline metrics.

Form-based reporting and source governance

Lead capture forms provide measurable entry points for website, event, research, content, and meeting requests.

LEAD CAPTURE SYSTEM08

Form-based MQL creation and source-specific routing

Seventeen forms feed defined automation paths for website, event, research, content, and meeting requests.

CAPTURE ARCHITECTURE

1

Demo / Meeting Request

High-intent forms create an MQL Lead and sales task.

2

Tradeshow Lead Capture

Event submissions create Leads with a source-specific follow-up path.

3

Content Download

Resource requests enter a measured nurture process.

4

Website Ask a Question

General questions route to the correct owner without forcing a Deal.

5

Research Community

Community submissions enter a dedicated qualification track.

STANDARD OUTPUT

Lead record

Created only for qualifying conversion paths.

Lead source

Populated from the originating form or campaign.

Owner

Mapped from Contact Owner or assigned by routing logic.

Task and alert

Follow-up action is created for the responsible team.

Reporting

Form, source, stage, and outcome remain measurable.

SCREENSHOT SUMMARY

The forms inventory shows the measurable entry points that create or update HubSpot records. Page views, submissions, conversion rates, publishing status, and placement data allow teams to compare lead-capture assets and connect source activity with downstream lead and deal outcomes.

Operational visibility across the funnel

Segments, dashboards, and reports turn HubSpot records into a repeatable operating system for sales and marketing.

Reporting coverage
The operational views organize lead aging, stage distribution, deal velocity, revenue forecasting, team activity, and conversion outcomes into reusable reports. This gives sales and marketing teams a consistent way to review the funnel, investigate exceptions, and act on stale or underperforming records.

Reusable report portfolio

A structured report library gives sales leaders and operators consistent access to the metrics they need.

REPORTING LIBRARY

05

Custom reports and revenue intelligence

A reusable report library organizes lead health, sales performance, deal velocity, and revenue forecasting.

REPORTING VALUE

- Report structure: Centralize lead, deal, velocity, and forecast reporting.
- Consistent logic: Apply consistent owner, date, stage, and pipeline logic.
- Operational views: Move from raw CRM records to operational sales views.
- Organize reports for dashboards

REVENUE VISIBILITY

A connected HubSpot reporting system for sales and marketing

The final reporting framework improves visibility across sales activity, lifecycle performance, automation, and CRM governance.

PORTFOLIO SUMMARY

The screenshots collectively document the full reporting system: executive dashboards, activity metrics, lifecycle governance, workflow monitoring, trigger controls, forms, pipeline reporting, and reusable report assets. The result is a connected HubSpot environment where operational data can be reviewed, trusted, and acted on.

Centralized visibility

Core sales and marketing KPIs in one place.

Pipeline confidence

Consistent stage and goal reporting.

Operational control

Lifecycle and automation governance.

Scalable reporting

Reusable dashboards, reports, and segments.
